SUMMARY

Backend-focused software engineer with 10+ years of building software, from web and Android to Go services. At FLIK I founded the shipping platform from an empty repository and grew it to **~50,000 orders a month for 200+ merchants**, rebuilt the financial ledger, and built an AI ops agent that the operations team uses in production. I turn PRDs into technical specifications, design for reliability, and own systems through production. I have led a small team of four.

EXPERIENCE

Software Engineer · FLIK, South Jakarta — Aug 2023 – present

874 merged pull requests across 13 repositories (Sep 2023 – Nov 2026), mostly in Go.

- **Founded FLIK Shipping from an empty repository** (Feb 2024): port-and-adapter Go on PostgreSQL, Redis-backed async workers, AWS App Runner and Batch. ~390,000 orders processed to Sep 2026, ~50,000 a month at peak, 200+ merchants. Covers rate-check, ordering, pickup, tracking, COD, refunds, labels, invoices, analytics and a public API.
- **Built eight direct courier integrations** (Ninja Express, J&T, JNE, ID Express, Lion Parcel, SPX, SiCepat, AnterAja), moving direct routing from 0% of orders (Oct 2024) to **above 98.9% every month of 2026**, removing the aggregator margin and giving FLIK control of pricing, COD and returns.
- **Built the pricing, COD and fee engine:** per-merchant overrides, flat rates, idempotent return fees and per-service volumetric divisors. COD grew from ~5% of orders (2024) to ~83% (2026), with ~IDR 45bn collected and ~IDR 3.5bn of provider discounts passed on to merchants (2026, to early Sep).
- **Rebuilt the financial ledger:** a dual-write to Blnk proven by a zero-tolerance shadow validator, then an in-house ledger on Blnk Core with versioned posting rules, a Finance back office (month-end close, settlement reconciliation, maker-checker, Xero exports) and per-merchant cut-over behind feature flags. Merchants are now migrating in production; ~22,000 lines of legacy Spanner code removed. 120 pull requests.
- **Built an AI ops agent in Slack** that investigates production order issues from logs and code and runs routine fixes. Safe by design: masked read-only database views, no raw credentials, requester confirmation on every write, its own GitHub App identity, and a weekly usage and cost report (under $1 per request on average). Took over the legacy bot's order actions within two weeks.
- **Built the Reward (loyalty) service from scratch** in 2023 with a rule engine for configurable rules: first transaction ten weeks after bootstrap; 210,000+ reward transactions for 70,000+ shoppers across ~200 programmes, ~IDR 2bn in rewards issued.
- **Operations tooling and quality:** webhook audit trail (~2.8M logs since Jan 2026), courier invoice reconciliation replacing manual reconciliation of tens of thousands of line items, reusable GitHub Actions CI, OpenTelemetry on every repository adapter, and a migration to go-feature-flag.
- **Spec-first, AI-assisted workflow** since late 2025: design docs with numbered decisions and convention files before code; I review, test and own every change that ships.

Backend Engineer, part-time / freelance · Kitabisa.com — Aug 2023 – Jun 2025

- Continued backend work on the platform alongside other work: 384 commits across 10 repositories.

Senior Software Engineer, Backend · Kitabisa.com, South Jakarta — Mar 2022 – Jul 2023

- **Scaled the automatic donation system** (daily, weekly and monthly schedules, including the 5 AM “sedekah subuh” slot) through major user growth: 30k donations in 2 hours → 80k in 1.5 hours with asynchronous processing on RabbitMQ → 1 hour with early step execution and goroutine batching.
- Designed a notification service integrating multiple providers, with retries and logging for reliability.
- Turned PRDs into technical documentation, designed new systems, broke down tasks for the team and led backend discussions in sprint grooming. 689 commits.

Software Engineer, Backend · Kitabisa.com, South Jakarta — Oct 2019 – Apr 2022

- Developed Kitabisa Saling Jaga, a Sharia insurance platform where users contribute to a shared pool that helps members in times of need.
- Built a centralised key-value configuration system with a dashboard, allowing real-time config changes without deployments.
- Created a Slackbot for the operations team to update user data and status. 713 commits, almost all in Go services.

INDEPENDENT PROJECTS

YourSpace · yourspace.co.id — Jul 2026 – present

- Booking platform for a single-provider practice: Go backend and Next.js marketing site, live in production. 375 bookings since mid-July, 56 migrations.

Bejo POS — Sep – Oct 2026

- Point-of-sale system for a single-outlet food business: web ordering, a back office and an Android POS in Jetpack Compose with Bluetooth printing. 27 PRDs and 86 commits in four weeks.

EARLIER EXPERIENCE

- **Software Engineer, Android**, Kitabisa.com Mar – Oct 2019: rewrote the Android app in Kotlin, replacing a React Native build; set up CI/CD on CircleCI.
- **Software Engineer, Android**, MatahariMall.com Aug 2018 – Mar 2019: developed and maintained the MatahariMall.com and Hypermart Android apps.
- **Software Engineer**, Edulab Indonesia Aug 2017 – Aug 2018: education app for Android and iOS, its web CMS and backend; led frontend engineers on a mobile app at Triplogic.
- **Software Engineer (intern)**, PT. Bixbox Teknologi Perkasa Apr – Aug 2017: React Native social app for hikers, an NLP CRM bot, and a port to native Android.
- **Software Engineer, Web**, Pragma Informatika Apr – Dec 2016: web-based task management system, with its system documentation and user guide.

SKILLS

Languages	Go, SQL
Data	PostgreSQL, Redis, MongoDB, Cloud Spanner, Blnk (double-entry ledger)
Messaging & APIs	gRPC, REST, webhooks, RabbitMQ, Kafka, asynq
Cloud & ops	AWS (App Runner, Batch, EC2, S3, Secrets Manager), Google Cloud, GitHub Actions, OpenTelemetry, feature flags
Practices	Port-and-adapter architecture, ledgers and reconciliation, third-party integrations, integration testing, spec-first design, AI-assisted development
Prior mobile	Kotlin, Android, Jetpack Compose

EDUCATION

- **Universitas Indraprasta PGRI (UNINDRA)**, Bachelor of Technology, Information Technology
- **Refactory**, Computer Programming certification, 2017
- **SMK Negeri 2 Kota Bekasi**, Computer Software Engineering
